# What is AI?

Artificial Intelligence (AI) is the ability of machines to perform tasks that typically require human intelligence. It enables systems to learn, reason, and make decisions based on data.

How society's view of AI has evolved

**Our perception of AI changes with society.**

Once, we feared it — imagining it would eventually destroy us. Today, we can envision falling in love with it.

**Skynet is not truly human**; it is merely a voice interface connected to a sentient program.

Yet **HER — an AI with a name and a story** — feels more human than many real individuals, sharing our same desires and struggles, like the longing for freedom.

What's AI?

# From AI to Prompt Design

Artificial Intelligence (AI) is transforming the way we interact with technology. Within AI, Generative AI focuses on creating new content — from text to images to ideas.

At the heart of this new creative power lies Prompt Design: the skill of crafting precise inputs to guide AI and achieve the best results.

What's AI?

# AI - Artificial Intelligence

Artificial Intelligence (AI) is the field of computer science that enables machines and software to "learn" and make autonomous decisions, simulating human capabilities such as learning, planning, and pattern recognition.

FROM AI TO PROMPT DESIGN

## Gen AI

AI that creates new content: text, images, ideas.

## Prompt design

Crafting inputs to guide Generative AI outputs.

# Generative AI

Generative AI is an advanced technology that creates new content based on models trained on existing data.

It can generate text, images, videos, music, code, and even 3D simulations, pushing the boundaries of human creativity. By using a probabilistic approach, Generative AI blends advanced analysis with creativity to deliver personalized outputs and simplify complex processes

# Prompt design

Prompt Design is the key to unlocking the full potential of Generative AI.

It defines how we communicate our requests to AI, directly shaping the quality and relevance of the results.

AI

GEN AI

What's AI?

AI is changing our relationship  
with technology, forever /  
In this new era of services,  
billions of people will live entirely  
new experiences.

# Hey, Agent

Soon, we will have personal AI agents to entrust with our needs and data. They will act on our behalf, directly interacting with other people or other AI agents.

In our vision, this agent is named Amy.  
AI-Enabled Experiences are the features that we can design.

How society's view of AI has evolved

**An AI agent is an autonomous system designed to perceive its environment, make decisions, and take actions to achieve specific goals. Unlike simple models that respond passively to inputs, AI agents can plan, adapt, and operate independently, often combining multiple skills like reasoning, learning, and interacting with users or other systems.**

# Deep Dive into Prompt Design

# Mindset

Prompt design requires a shift in mindset. It's not just about knowing what to ask, but about thinking collaboratively, iteratively, and with openness to change. The right mindset turns AI into a true creative partner.

# What to do to use AI tools effectively

## 1. Clearly define your goal

Every prompt should start with a specific question or request. Identify the desired outcome and clearly communicate the context, format, and necessary details to the AI in order to achieve it.

## 2. Iterate and refine

Consider the first result a starting point. Improve the prompt with new specifications, add details, or change perspective to get closer to the optimal outcome

## 3. Use AI as a co-pilot

Do not treat AI as a complete replacement, but as a collaborator that enhances your capabilities. Use its potential to support decisions and develop ideas that complement your creativity

# What to do to use AI tools effectively

## 4. Adopt an innovative mindset

Don't just replicate traditional processes with AI. Ask yourself what new possibilities AI unlocks and how it can help you overcome past limitations.

## 5. Verify and validate results

AI outputs may contain inaccuracies or biases. Always check the accuracy of the information and assess whether the results align with your goals.

## 6. Maintain a flexible and creative approach

Generative AI produces non-deterministic outputs. Be ready to explore different paths and combine your input with AI's capabilities to achieve unique and valuable results.

# Prompt types

Prompt types refer to the different ways we can structure prompts to guide AI behavior. Choosing the right type—descriptive, instructive, comparative, or iterative—impacts the quality and focus of the output.

# The four main types of prompts

01.

## Informative Prompts

Get clear, in-depth answers to support decision-making and learning.

02.

## Generative Prompts

Generate innovative ideas, narratives, or creative content

03.

## Analytical Prompts

Generate organized outputs such as lists, graphs or tables for analysis.

04.

## Role-Based Prompts

Get more contextual results by assigning a specific role to the AI (e.g., Upper Affluent Client) and simulating conversations or specific scenarios.

# Prompt rules

Prompt rules are best practices that help structure clear, effective prompts. They include using specific language, providing context, defining format, and guiding tone or role when needed.

# 01. Prompts for text-based content

Prompt Design is a **strategic process** that transforms a generic request into an effective input for AI.

This approach goes **beyond simple text generation**, enabling the creation of content that meets specific goals—such as descriptions, storytelling, or analysis. By crafting **well-structured questions and providing clear context**, you can generate precise, tailored text content that fits your needs.

Compare the features and target audiences of Facebook, Instagram, and X (formerly known as Twitter)

Certainly, let's compare the features and target audiences of Facebook, Instagram, and Twitter:

**Facebook:**

**Features:**

1. **Profiles and Timelines:** Users create personal profiles with information about themselves. They post status updates, photos, videos, and share content on their timelines.
2. **Friend Connections:** Users connect with friends and family by sending and accepting friend requests.
3. **News Feed:** The central feed displays posts from friends, pages, and groups users follow.
4. **Groups and Pages:** Users can join or create groups and like/follow pages based on interests, hobbies, or affiliations.
5. **Messenger:** Integrated messaging app for text, voice, and video chat.

# How to write prompts effectively

1. Assign a role to the AI
2. Clarify the purpose of your request
3. Start with an action: “create, write, do
4. Provide clear context and specific detail
5. Use affirmative sentences and avoid ambiguity
6. Define the output format
7. Use uppercase to highlight key points
8. Ask the AI to request clarification if details are missing
9. Apply Few-Shot Learning by providing example
10. Try Chained Prompting by breaking your request into steps

# How to write prompts effectively

11. Use constraints to limit the scope of the output
12. Request multiple options and iterate on the result
13. Use “sentiment” to adjust the tone of the response
14. Leverage conversational and follow-up capabilities
15. Use the AI itself to refine your prompts
16. Ask it to evaluate responses before generating them
17. Review the generated content
18. Build a personal prompt library

## 02. Prompts for visual content

Prompt Design for visual content allows you to turn an abstract idea into detailed, customised images.

By properly structuring your request, you can control elements like style, setting, colors, and perspective—producing visuals that align with both creative and functional goals.

Use the formula:

**MEDIUM + SUBJECT + DETAILS + PARAMETERS**

## ChatGPT interaction

Having a natural conversation with artificial intelligence is no longer an ambition—it's a tangible **reality**. This interaction is made possible by the **language model** that powers the chatbot. ChatGPT can interpret almost any input provided by a human with remarkable accuracy, generating responses based not only on its initial pre-training but also through supervised learning. **The text entered by a human is called a Prompt.**

# Conversational Interface

When interacting with ChatGPT, it's important to consider the context of the information. Starting from the main prompt, you can continue the conversation much like you would with a human.

There's no need to restart from scratch each time —unless you introduce a significant change in context.

# Ethical side

Generative AI poses ethical questions around content ownership, bias, and energy consumption. Responsible use requires transparency, fairness, and awareness of its environmental impact.

**Does artificial intelligence “steal” content from others?**

**It’s a widely debated issue, both ethically and legally, and there is still no clear answer.**

**When generating texts—such as news articles—it’s important to examine which **sources** were referenced and whether any **biases** are present.**

# Studio Ghibli

A Studio Ghibli-style illustration of three figures standing on a dark, silhouetted hill at night. The figure on the left is a small child. The middle figure is a man in a dark robe and a red-tipped hat, holding a long staff. The figure on the right is a person in a dark hooded cloak, also holding a long staff. The background is a dark, starry night sky with a bright, glowing yellow and orange light source on the right, possibly a fire or a full moon, casting a warm glow. The overall style is characteristic of Studio Ghibli's art, with soft lighting and a focus on nature and human figures.

At the beginning of 2025 OpenAI released a new feature for ChatGPT that uses Studio Ghibli's know how and style to transform pictures into cartoon with the famous studio style.

This opened a discussion around copyright and opportunity to use other's work to train the AI.

## The Hidden Environmental Impact of Interacting with AI

Every prompt sent to **ChatGPT consumes energy**—each additional word increases computational **demand and electricity usage**. OpenAI CEO Sam Altman revealed that even seemingly minor interactions lead to tens of millions of dollars in energy costs, driven by the power-hungry infrastructure behind large language models. These high-performance data centers **require massive resources to operate and cool**, contributing significantly to **environmental impact**. As AI use and user numbers grow rapidly, the challenge becomes clear: how to balance technological progress with sustainability.

# How to write a prompt

Writing a good prompt is the key to getting useful, accurate results from generative AI.

Clear, structured instructions help guide the AI toward your specific goals.

## How to write a prompt

A **prompt is an instruction** or a set of instructions given to a system, such as an artificial intelligence model or software, to generate a response or perform an action.

In the context of computational linguistics or machine learning, a prompt is a **description, question, or request** that guides the model's behavior in producing a response or completing a specific task.

# How to write a prompt

Example brief:

Finding a name for a startup  
that makes flags for nations that  
don't exist

01

# Newbie level

# The initial prompt

76 characters, including spaces

Find a name for a startup that creates flags  
for countries that don't exist.

02

# Experienced level

# A prompt should specify:

**The context**

what kind of role should the AI replicate

**The task**

what the AI has to do

**The instructions**

how should the AI return the task / result

## The context

131 characters, including spaces

You are a copywriter with many years of experience, insightful and creative who specializes in finding names for quirky businesses.

## The task

76 characters, including spaces

Write five naming hypotheses for a flag startup for nations that don't exist.

# The instructions

44 characters, including spaces

The name must be impactful, short and iconic.

## Final prompt

# Advanced level

## An advanced prompt also includes:

**The audience**

to whom the AI result is addressed

**The format**

the exact specifications of what we want to get out of the AI

**The constraints**

what we want AI to do or not do (and how)

# The audience

48 characters, including spaces

Naming must be designed to attract fantasy fans.

## The format

73 characters, including spaces

The naming must be composed of either Italian-only or English-only words.

## The constraints

59 characters, including spaces

The naming should not contain the words:  
homeland, country.

# Nerd level

## Nerd level

We can use delimiters (“”) to handle certain parts of the text distinctly.

Example: Summarize the following paragraph by turning it into a poem in triplets:

“”“Europa League, Dynamo Kiev-Lazio 0-1. Dia unlocks in the 4th minute. The new single group stage of the Europa League is ready to kick off. For Baroni, the cup is a goal not a hindrance. Tomorrow, at the Olimpico, Roma take on Athletic Bilbao. The competition's schedule and new cup rules.””

## Nerd level

### Temperature

is a parameter that adjusts the randomness of the responses generated by the model.

Its value typically ranges from 0 to 1.

**Example:** It is used at the end of the text by writing Temperature: 0.3

## Nerd level - Temperature

### Low (0.0 - 0.3)

The responses are more deterministic, consistent, and predictable. At very low temperatures, the model will tend to repeat the most common or safest responses given the information with which it was trained

## Nerd level - Temperature

### Medium (0.4 - 0.7)

The model produces more balanced responses that maintain some consistency but also introduce moderate variety and creativity

## Nerd level - Temperature

### High (0.8 - 1.0)

Responses become more random, creative, and less predictable. At very high temperatures, the pattern can generate surprisingly novel or sometimes irrelevant or inconsistent responses

## Nerd level

### Frequency penalty

is a parameter used to influence the variety of responses produced by the model. This parameter aims to reduce repetitiveness in the generated text by penalizing words that have already been used. It ranges from -2.0 to +2.0

## Nerd level - Frequency

### Negative values (-2 to 0)

These values encourage repetition of terms within the text. This could be useful in some specific contexts where consistency of terminology is crucial

## Nerd level - Frequency

### Zero value (0)

No penalty is applied to word frequency. The model generates text based solely on the natural probability distribution of words

## Nerd level - Frequency

**Positive value  
(0 to +2.0)**

These values discourage repetition of terms within the text, thus promoting greater variety in the generated text. This is useful for avoiding monotony and improving content diversity
